Operation Cost* To estimate the cost to operate this heater, multiple the watts used times .001 to convert into a kilowatts measure and multiply by your local kilowatt electric rate for however long you run the heater. For example, if your electric rate is \$.1196** per kilowatt hour and you ran this heater in constant high mode (1500 watts) for 4 hours, it would cost you \$.71 cents to run the heater (1500 watts x 4 hours x .001) x .1196kwp = .71 cents.

NOTE: Because the Low setting does not require as much electricity to operate, it is more energy efficient and may be a better option if you are concerned about the higher power consumption when the heater is on the High setting.

*Calculation (Total Wattage x .001) x Cost per Kilowatt Hour = Cost to operate
